Section 3: Practitioner Notes - From Practice to Identity

Lesson 3.1: The Resilient Sleeper

Executive Summary

This lesson introduces the mindset shift from "fixing sleep" to "being a resilient sleeper." It covers the Habit Loop (Cue, Routine, Reward) and the "Good, Better, Best" framework as tools for building sustainable, flexible rituals.

Clinical Insights

Focuses on identity-based habits, which are more durable than goal-based habits. The "Good, Better, Best" model is a practical application of cognitive flexibility, designed to counter the all-or-nothing thinking that often derails progress.

Lesson 3.2: The 24-Hour Sleep System

Executive Summary

Explores three key daytime levers for influencing nighttime sleep: strategic light exposure in the morning, timing of physical movement, and establishing a personal caffeine curfew.

Clinical Insights

This lesson reinforces that sleep is not an isolated event. It empowers patients by giving them actionable tools they can use throughout the day, increasing their sense of control and directly influencing their circadian rhythm and sleep pressure systems.

Lesson 3.3: Your Personal Sleep Blueprint

Executive Summary

A capstone lesson where users synthesize all learned skills into a single, personalized document. It encourages users to write down their specific protocols for wake-up time, rituals, and handling bad nights.

Clinical Insights

The act of writing down a plan significantly increases commitment and adherence. This interactive exercise serves as a powerful form of self-contracting and provides a tangible takeaway that reinforces the user's new identity and skills.

Lesson 3.4: Your Journey Forward

Executive Summary

This final lesson teaches long-term maintenance strategies, including the "Review & Refine" loop for continuous improvement and protocols for handling major life disruptions. It also clearly outlines when to seek professional support again.

Clinical Insights

This models the "relapse prevention" component of CBT. The ultimate therapeutic goal is patient autonomy. By teaching users how to self-monitor, adapt their plan, and recognize when they need more support, we equip
