Food-Mood Mastery: Clinical Integration & Emerging Science

The capstone course — integrating clinical guidelines, genetics, special populations, and cutting-edge nutritional psychiatry research

CAPSTONE COURSE

NUTRITIONAL PSYCHIATRY

From Science to Practice

You've learned the foundations: gut-brain axis, dietary patterns, precision nutrition. Now it's time to put it all together.

Clinical Integration

Applying ISNPR guidelines directly in practice with evidence-based nutritional psychiatry protocols

Genetic Considerations

MTHFR, COMT, and nutrigenomics for truly personalized nutrition recommendations

Special Populations

Perinatal, pediatric, older adults, and eating disorder-specific approaches

Emerging Research

Ketogenic diets, intermittent fasting, AI-guided nutrition, and planetary health

What You'll Learn

A comprehensive curriculum spanning clinical guidelines, genetics, mindful eating, and the frontiers of nutritional psychiatry.

ISNPR Clinical Practice Guidelines

Evidence-based nutritional psychiatry standards for clinical application

Nutrigenomics: MTHFR & COMT

Personalized nutrition through genetic insight and precision supplementation

Mindful & Intuitive Eating

Therapeutic frameworks for mental health and sustainable behavior change

Perinatal Nutrition & PPD Prevention

Omega-3 protocols and micronutrient strategies for maternal mental health

Pediatric Nutrition & Mental Health

School-based programs and developmental nutrition for cognitive outcomes

Older Adults: MIND Diet & Polypharmacy

Nutrient depletion, medication interactions, and malnutrition risk management

Eating Disorders: Trauma-Informed Care

Safety protocols, orthorexia awareness, and compassionate clinical approaches

Emerging: Keto, IF & AI Nutrition

Cutting-edge interventions and technology-guided personalization

Special Populations Matter

Nutritional psychiatry isn't one-size-fits-all. Each population requires tailored, evidence-based approaches grounded in their unique physiological and psychological needs.

Perinatal & Postpartum

Pregnant women need **EPA-dominant omega-3s** at a ratio ≥1.5:1. Targeted supplementation reduces postpartum depression risk and supports fetal neurodevelopment.

Children & Adolescents

School-based nutrition programs improve cognitive performance, emotional regulation, and long-term mental health outcomes. Early intervention is key.

Older Adults

The MIND diet, polypharmacy-nutrient interaction screening, and malnutrition risk assessment are essential pillars of geriatric nutritional psychiatry.

The Future of Nutritional Psychiatry

The field is evolving at an extraordinary pace. You'll be positioned at the cutting edge of science, practice, and planetary impact.

Ketogenic Metabolic Therapy

Emerging evidence supports ketogenic dietary interventions for **treatment-resistant bipolar disorder**, offering a metabolic pathway to mood stabilization where pharmacology has fallen short.

Time-Restricted Eating & Anxiety

Intermittent fasting protocols are demonstrating measurable **amygdala connectivity changes** in anxiety disorders — linking circadian nutrition timing to neurological regulation.

EAT-Lancet 2025 Planetary Health Diet

The landmark planetary health framework projects **15 million prevented deaths annually** — aligning mental health nutrition with global ecological sustainability goals.

AI-Guided Precision Nutrition

Machine learning and microbiome profiling are enabling **hyper-personalized dietary prescriptions** that adapt in real time to individual metabolic and psychological responses.

15M

Deaths Prevented

Projected annually by the EAT-Lancet planetary health diet

≥1.5:1

EPA:DHA Ratio

Recommended omega-3 ratio for perinatal mental health outcomes

12

Lessons

Comprehensive modules covering the full spectrum of nutritional psychiatry

14hrs

Learning Time

12–14 hours of the most advanced content in the Nutrition Track

Course Structure

At a Glance

12 Lessons

Structured modules from clinical guidelines to emerging frontiers

12–14 Hours

The most advanced course in the full Nutrition Track curriculum

SELF-PACED | EVIDENCE-BASED

What Makes This Course Different

01

Clinical Guidelines Integration

ISNPR standards applied directly to real-world practice scenarios

02

Genetics & Precision Nutrition

MTHFR, COMT, and nutrigenomic frameworks for individualized care

03

Special Population Modules

Dedicated deep-dives into perinatal, pediatric, geriatric, and eating disorder care

04

Emerging Research Frontiers

Ketogenic therapy, intermittent fasting, AI nutrition, and planetary health

This is the capstone of the Nutrition Track — designed for clinicians ready to lead the next generation of evidence-based, personalized, and planet-conscious mental health nutrition practice.
